

Final Exam

For the average reward setting, the differential state value function is defined as:

$$E_{\pi} \left(s \right) \doteq E_{\pi} \left[\sum_{k=l+1}^{\infty} \left(R_{k} - \Upsilon(\pi) \right) \right] S_{t} = s$$

where the average reward is

$$r(\pi) = \lim_{t \to \infty} E_{\pi} \left[\frac{1}{h} \sum_{t=0}^{h-1} R_{t+1} \right].$$

Derive the following Bellman equation for v_{tc} 5

$$\mathcal{L}_{\mathcal{L}}(s) = \sum_{\alpha} \mathcal{L}(\alpha|s) \sum_{\beta} p(s_{\beta}, r_{\beta}|s_{\beta}) \left[r_{\alpha}r(r_{\alpha}) + \mathcal{U}_{\mathcal{L}}(s')\right]_{\mathcal{L}}$$

$$= \sum_{\alpha} \mathcal{L}_{\alpha}(a|s) \sum_{\beta} p(s_{\beta}, r_{\beta}|s_{\beta}) \left[r_{\alpha}r(r_{\alpha}) + \mathcal{U}_{\mathcal{L}}(s')\right]_{\mathcal{L}}$$

$$= \sum_{\alpha} \mathcal{L}_{\alpha}(a|s) \sum_{\beta} p(s_{\beta}, r_{\beta}|s_{\beta}) \left[r_{\alpha}r(r_{\alpha}) + \mathcal{U}_{\mathcal{L}}(s')\right]_{\mathcal{L}}$$

$$= \sum_{\alpha} \mathcal{L}_{\alpha}(a|s) \sum_{\beta} p(s_{\beta}, r_{\beta}|s_{\beta}) \left[r_{\alpha}r(r_{\alpha}) + \mathcal{U}_{\mathcal{L}}(s')\right]_{\mathcal{L}}$$

$$= \sum_{\alpha} \mathcal{L}_{\alpha}(a|s) \sum_{\beta} p(s_{\beta}, r_{\beta}|s_{\beta}) \left[r_{\alpha}r(r_{\alpha}) + \mathcal{U}_{\mathcal{L}}(s')\right]_{\mathcal{L}}$$

$$= \sum_{\alpha} \mathcal{L}_{\alpha}(a|s) \sum_{\beta} p(s_{\beta}, r_{\beta}|s_{\beta}) \left[r_{\alpha}r(r_{\alpha}) + \mathcal{U}_{\mathcal{L}}(s')\right]_{\mathcal{L}}$$

$$= \sum_{\alpha} \mathcal{L}_{\alpha}(a|s) \sum_{\beta} p(s_{\beta}, r_{\beta}|s_{\beta}) \left[r_{\alpha}r(r_{\alpha}) + \mathcal{U}_{\mathcal{L}}(s')\right]_{\mathcal{L}}$$

$$= \sum_{\alpha} \mathcal{L}_{\alpha}(a|s) \sum_{\beta} p(s_{\beta}, r_{\beta}|s_{\beta}) \left[r_{\alpha}r(r_{\alpha}) + \mathcal{U}_{\mathcal{L}}(s')\right]_{\mathcal{L}}$$

Show steps.

LOTE: Law of total expectation

1.
$$E(X) = E(E(X \mid Y));$$

运算过程 [編輯]

$$\operatorname{E}(\operatorname{E}(X|Y)) = \sum_{y} \operatorname{E}(X|Y=y) \cdot \operatorname{P}(Y=y)$$

$$= \sum_{y} \left(\sum_{x} x \cdot \operatorname{P}(X=x|Y=y)\right) \cdot \operatorname{P}(Y=y)$$

$$= \sum_{y} \sum_{x} x \cdot \operatorname{P}(X=x|Y=y) \cdot \operatorname{P}(Y=y)$$

Modify the Tabular TD(0) algorithm for estimating v_{π} , to estimate q_{π} .

Tabular TD(0) for estimating v_{π}

- Input: the policy π to be evaluated
- **2** Algorithm parameter: step size $\alpha \in (0,1]$
- Initialize V(s), for all $s \in S^+$, arbitrarily except that V(terminal) = 0
- 4 Loop for each episode:
- Initialize S
- Loop for each step of episode:
- $A \leftarrow$ action given by π for S
- Take action A, observe R, S'
- $S \leftarrow S'$ $V(S) \leftarrow V(S) + \alpha \left[R + \gamma V(S') V(S) \right]$
- until S is terminal

Sarsa

3. Sarsa算法(on-policy)

```
Sarsa (on-policy TD control) for estimating Q \approx q_*
Algorithm parameters: step size \alpha \in (0,1], small \varepsilon > 0
Initialize Q(s,a), for all s \in S^+, a \in A(s), arbitrarily except that Q(terminal, \cdot) = 0
Loop for each episode:
   Initialize S
   Choose A from S using policy derived from Q (e.g., \varepsilon-greedy)
   Loop for each step of episode:
      Take action A, observe R, S'
      Choose A' from S' using policy derived from Q (e.g., \varepsilon-greedy)
      Q(S,A) \leftarrow Q(S,A) + \alpha \left[ R + \gamma Q(S',A') - Q(S,A) \right]
      S \leftarrow S'; A \leftarrow A';
   until S is terminal
```

Easy Edu

Ans.

"Q(S,A)
$$\leftarrow$$
 Q(S,A) $+ \propto [R + \gamma Q(S',A') - Q(S,A)]"$

Show that the following off-policy TD(0) update for unis correct for transition S, Anb, S', R:

$$V(S) \leftarrow V(S) + \propto \left[S(A|S)(R+VV(S')) - V(S) \right]$$

by showing the following:

$$E_{A\sim b}\left[P(A|S)(R+\delta V(S'))-V(S)|S=S\right]$$

$$= E_{A \sim \pi} \left[R + v \vee (S') - \vee (S) \middle| S = s \right].$$

Here,
$$S(A|S) = \frac{\pi(A|S)}{b(A|S)}$$
, π and b are

policy dismibutions with assumption

Easy Edu

Let's first work on the target when 12558

$$E_{A\sim b} \left[S(A)S \right) \left(R + \delta V(S') \right) \left| S = S \right]$$

$$= \sum_{\alpha,\beta,r} P_b \left(A = \alpha, S = \beta, \mathcal{R} = r \middle| S = \delta \right) S(\alpha \mid s) \left(r + \delta \bigvee_{\alpha,\beta,r} \mathcal{R} \right)$$
Qian Yuchen 12558

$$= \sum_{a,s',r} b(a|s) p(s',r) s,a) \frac{\pi(a|s)}{b(a|s)} (r+\gamma) (s')$$

$$= \sum_{a,s,r} b(s',r)s,a) \pi(a|s)(r+r)(s')$$

$$= E_{A \sim \pi} \left[R + V V(S') \middle| S = S \right] .$$

On the other hand,

$$E_{A \sim b} \left[V(S) | S = s \right] = V(s).$$

Therefore, the identity follows from (1-(2).

4. (20)2558

Give the specification of the off-policy Expected Sarsa control method.

= EZ Academy

Sarsa

3. Sarsa算法(on-policy)

```
Sarsa (on-policy TD control) for estimating Q \approx q_*
Algorithm parameters: step size \alpha \in (0,1], small \varepsilon > 0
Initialize Q(s,a), for all s \in S^+, a \in A(s), arbitrarily except that Q(terminal, \cdot) = 0
Loop for each episode:
   Initialize S
   Choose A from S using policy derived from Q (e.g., \varepsilon-greedy)
   Loop for each step of episode:
      Take action A, observe R, S'
      Choose A' from S' using policy derived from Q (e.g., \varepsilon-greedy)
      Q(S,A) \leftarrow Q(S,A) + \alpha \left[ R + \gamma Q(S',A') - Q(S,A) \right]
      S \leftarrow S'; A \leftarrow A';
   until S is terminal
```

Sarsa

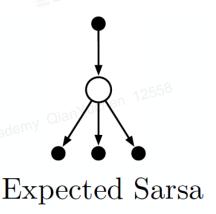

4. Expected Sarsa公式 (off-policy)

$$Q(S_{t}, A_{t}) \leftarrow Q(S_{t}, A_{t}) + \alpha \left[R_{t+1} + \gamma \mathbb{E}[Q(S_{t+1}, A_{t+1}) \mid S_{t+1}] - Q(S_{t}, A_{t}) \right]$$

$$\leftarrow Q(S_{t}, A_{t}) + \alpha \left[R_{t+1} + \gamma \sum_{a} \pi(a \mid S_{t+1}) Q(S_{t+1}, a) - Q(S_{t}, A_{t}) \right]$$

- St+1时look back
- current state 是 St+1
- 5. Sarsa与Expected Sarsa的关系
 - Sarsa是on-policy, Expected Sarsa多数情况下是off-policy

$$Q(S_t, A_t) \leftarrow Q(S_t, A_t) + \alpha \Big[R_{t+1} + \gamma Q(S_{t+1}, A_{t+1}) - Q(S_t, A_t) \Big]$$

Give the specification of the off-policy Expected Sarsa control method.

Ans. For the transition S,A, R, Ster where the action Arb is drawn from policy distribution b, up date the action value the following way:

 $Q(S,A) \leftarrow Q(S,A) + \propto \left[R + \sqrt{S} \pi(a'|S')Q(S',a') - Q(S,A)\right]$

where the target policy # \$ b and off-policy uses greetefication such as E-greedy;
